

AI-Powered Troubleshooting That Never Leaves Your Instance

A conversational assistant that gives Solutions Consultants the power of AI-assisted exploration, diagnosis, and configuration — running entirely within the ServiceNow platform using the customer's own approved LLM.

Zero data egress • No external dependencies • Customer LLM only

THE CHALLENGE

Why We Built This

Solutions Consultants face a critical gap: modern AI tools are transforming how engineers work — but data privacy policies prevent using any of them on customer POC instances. Meanwhile, troubleshooting ServiceNow configurations remains manual, repetitive, and time-intensive.

CHALLENGE 01

AI Tools Blocked by Privacy

SCs cannot use Claude, Copilot, ChatGPT, or any external AI when working on POC instances with customer data. Corporate data privacy policies prohibit sending customer data to external services — leaving SCs without the AI-assisted workflows every other engineer relies on.

CHALLENGE 02

Manual Instance Exploration

Navigating ServiceNow requires extensive clicking through tables, querying logs, inspecting ACLs, and tracing business rules. Even experienced SCs spend 30–60 minutes per troubleshooting issue repeating well-known diagnostic patterns.

CHALLENGE 03

Knowledge Silos

Platform expertise lives in the heads of senior SCs. Common issues follow predictable patterns, yet every team member must rediscover solutions independently. Onboarding new SCs takes 2–4 weeks to reach basic proficiency.

CHALLENGE 04

Configuration Complexity

Setting up ServiceNow features requires creating numerous records across multiple tables in a specific order. Mistakes are silent and hard to diagnose — a missed assignment rule or inactive business rule can take hours to find.

THE SOLUTION

How It Works

The Platform Assistant is a server-side ReAct agentic loop that runs entirely within the ServiceNow instance. SCs interact through a conversational chat interface — asking natural language questions that the assistant answers by querying tables, inspecting schemas, analyzing logs, and traversing the CMDB. All LLM reasoning happens via the customer's own GenAI Controller.

**Tools Execute**

GlideRecordSecure
queries on-instance

**Answer Returned**

Analyzed results
with next steps

All processing remains within the ServiceNow instance boundary — no data leaves the platform

**The Critical Differentiator**

Unlike external AI tools, the Platform Assistant routes all LLM requests through ServiceNow's native GenAI Controller. It uses whatever model the customer has already approved — Now LLM, Azure OpenAI (BYOK), AWS Bedrock, or any other configured provider. No additional infrastructure. No data egress. No new vendor approvals.

CUSTOMER ENVIRONMENT**Fully On-Instance — Nothing External**

The Platform Assistant deploys as a lightweight set of ServiceNow-native artifacts — Script Includes, a Scripted REST API, two custom tables, and NASK skills. Everything runs using platform-standard APIs. There are no MID Server requirements, no external integrations, and no additional licensing beyond what the customer already has.

**What Stays on the Instance**

- All LLM reasoning via GenAI Controller (customer's LLM)
- All data queries via GlideRecordSecure (respects ACLs)

- Session state stored in custom tables
- Full audit trail of every tool execution
- Chat UI served as a ServiceNow SDK component

What Is NOT Required

- No external API calls or webhooks
- No MID Server or integration hub connections
- No additional LLM licensing (uses existing GenAI)
- No data exports or external processing
- No third-party plugins or marketplace apps

POC Deployment

- Deploy to any Yokohama Patch 4+ or Xanadu instance
- Minimal footprint: ~20 records total
- Clean removal — all records contained and reversible
- Works immediately with customer's existing GenAI setup
- No instance performance impact (standard API patterns)

Who Uses It

- **Solutions Consultants** — POC setup, troubleshooting, demos
- **Technical Consultants** — Implementation debugging
- **Platform Architects** — Architecture exploration
- Admin role for setup; itil role for daily usage
- Scales to any number of concurrent users

sessions + audit log

CAPABILITIES

What SCs Can Do

Natural Language Queries

Query any ServiceNow table using plain English. No encoded queries or GlideRecord syntax needed.

```
"Show me all P1 incidents from the last week"
```

Configuration Diagnosis

Cross-references business rules, ACLs, and assignment rules to identify root causes.

```
"Why aren't incidents auto-assigning to the right group?"
```

Schema Exploration

Inspect table structures, field types, and reference relationships on the fly.

```
"What fields does change_request have?"
```

Log Analysis

Search system logs by level, source, message, and time range without navigating syslog manually.

"Show me recent errors related to the CMDB"

CMDB Traversal

Walk upstream and downstream relationships to understand blast radius and service dependencies.

"What's the impact if this CI goes down?"

Platform Knowledge

Answers questions about ServiceNow platform behavior, evaluation order, and best practices.

"How does ACL evaluation order work?"

ARCHITECTURE

Technology Stack

A clean five-layer architecture built entirely with ServiceNow-native technologies. Each layer has a single responsibility and uses only platform-standard APIs.

● Client Layer	React • ServiceNow SDK
● API Layer	Scripted REST API
● Orchestration	PaAgentLoop • ReAct pattern
● Tool Registry	PaToolRegistry • Script Includes

SECURITY & COMPLIANCE

Built for Customer Trust

Security is the core value proposition, not an afterthought. Every architectural decision prioritizes data privacy and auditability.

Zero Data Egress

All data processing, LLM reasoning, and tool execution happens within the ServiceNow instance boundary. Verified by network trace — no external calls.

ACL-Respecting Queries

Every data access uses GlideRecordSecure, enforcing the authenticated user's role-based access controls. Users only see what they're authorized to see.

Complete Audit Trail

Every tool execution is logged with user, timestamp, action type, input, output, and target records. Full traceability for compliance reviews.

Confirmation-Gated Operations

Any destructive or modifying operation requires explicit user confirmation before execution. No silent changes to customer data.

BUSINESS IMPACT

Measurable Value

60–75%

POC Setup Time Reduction

50–75%

Troubleshooting Time Saved

4–8 hrs → 1–2 hrs per feature

30–60 min → 5–15 min per issue

Day 1

SC Productivity

vs. 2–4 weeks to proficiency

100%

AI Usage on Customer POCs

Up from 0% (privacy-safe)

Strategic Advantage

No competitor offers a privacy-safe AI assistant that works within the ServiceNow platform using the customer's own LLM. This tool encodes senior SC expertise into a repeatable, scalable resource that every team member can use from day one — on any customer instance, with zero privacy concerns.

REQUIREMENTS

What You Need

ServiceNow Version

Yokohama Patch 4+ or Xanadu (required for NASK / GenAI Controller support)

Plugins

Now Assist, Generative AI Controller, Integration Hub (standard enterprise plugins)

LLM Provider

Any model configured via GenAI Controller — Now LLM, Azure BYOK, AWS Bedrock, etc.

Access

Admin role for initial setup. itil or equivalent for daily usage by SCs.

ServiceNow Platform Assistant — Greg Pietro · Now AI Foundry · March 2026

All AI processing runs within the customer's ServiceNow instance. No external tools. No data egress. No exceptions.
